U.S. Patent and Trademark Office

Examiner, Art Unit 2617

Continuation of 11, does NOT place the application in condition for allowance because: Applicant submits that the limitation 'single frequency band' has support in the original disclosure, Applicant points to various parts of the instant Specificon where references to 802.11 standards are made as sufficient support for the limitation single frequency band. Such mentioning in the instant Specification is general in nature, and exemplary as to the applicability of the instant invention. However, in no where does instant Specification describes the frequency location of a preamble and payload as detailed by claim 1. Therefore, the examiner maintains the U.S.C. 112, first paragraph reliction, for including new matter.

Furthermore, the Applicant submits that the Examiner's proposed interpretation of "single frequency band" does not apply in this case (see page 10 of Applicant's remarks). However, the Applicant cites the example "an incoming signal is transmitted in the 2.4 GHz band under the IEEE 802.11 standard" (see Applicant's remarks page 7-8) as written requirement support for "single frequency band". Therefore, it is evident that the Applicant's own interpretation of a single frequency band directs to a group of nearby frequencies (i.e. 2.4 GHz band under IEEE 802.11 contains 11 channels or 11 sub-bands each with a center frequency and a bandwidth). Therefore, the Examiner's interpretation of the term "single frequency band" is consistent with the support for the term rising from Applicant's original disclosure. In view of foregoing reason, the examiner submits that Reiner discloses that the preamble (e.g. pulse sequency resides in the frequency range from 869.4 MHz to 869.65 MHz, and the payload (e.g. basic information) resides in the frequency range from 869.7 to 870.0 MHz. and the two non-overapping frequency ranges belong to the single (i.e. downlink) frequency band ranging from 869.4 MHz to 870.0 MHz.
